

The following definitions are not distinguishable to exclude STORMWATER and its POLLUTANT LOADS:

On-Site Treated Nonpotable Water [BSC]. Nonpotable water that has been collected, treated, and intended to be used on-site and is suitable for direct beneficial ...

Rainwater [BSC]. Precipitation on any public or private parcel that has not entered an offsite storm drain system or channel, a flood control channel, or any other stream

Rainwater Catchment System [BSC]. A facility designed to capture, retain, and store rainwater flowing off a building, parking lot, or any other manmade impervious

Rainwater should not include any water that has contamination from cars or fertilizers. You have not made that distinction. LA REGIONAL WATER BOARD issued the LA Municipal Separate Storm Sewer permit MS4, a NPDES permit. As you have written this, that water would qualify. It should not. Containment does not mean that there is not a PUBLIC HEALTH issue and a VECTOR CONTROL issue.

The State Department of Public Health does not have oversight and each County Public Health Department varies in regulations or guidance.
